

Data processing with XNAT and OpenStack

Christoph Jansen – HTW Berlin

Christoph Jansen

Computer Science Student:

International Media and Computing (Master) at HTW Berlin

Student Research Assistant:

QMROCT - Project

Internship at AMC:

for 1 Month

Content

The SOMNO.Netz Project

The QM-ROCT Project

Overview: server infrastructure

XNAT: data archiving and job pipelines

OpenStack: processing jobs in virtual machines

Todo: enabling new use-cases with Workflow-Management

SOMNO.Netz Project

Supporting Medical Association: DGSM (German Sleep Society)

- More than 2000 members, 300 sleep laboratories
- Research collaboration in sleep medicine
- Defines quality standards for sleep laboratories
- Organizing multicentric clinical trials

SOMNO.Netz Project

Proceeding to verify the quality of laboratories

- Website and database for reviewers and labs

Patient data and studies (e.g. Polysomnography)

- Collecting patient data for clinical studies
- Set of diagnostic tests
- Stored in XNAT
- Can be processed

QM-ROCT Project

Quality Management for Retinal Optical Coherence Tomography

- Charité Berlin, Beuth University of A.Sc. Berlin, HTW Berlin

Retinal OCT

- method for 3D and 2D scans of the human eye

Problem

- researchers depend on good quality scans
- how to extract good scans from huge databases

Quality Measures

Charité Berlin

- Medical department

Tasks

- Medical know-how
- Defining quality indicators

e.g.

- Is a scan good enough for a certain study?

Algorithms

Beuth University

- Physics department

Tasks

- Matlab: image processing
- Developing algorithms

e.g.

- Segmentation lines
- Amount of noise

Infrastructure

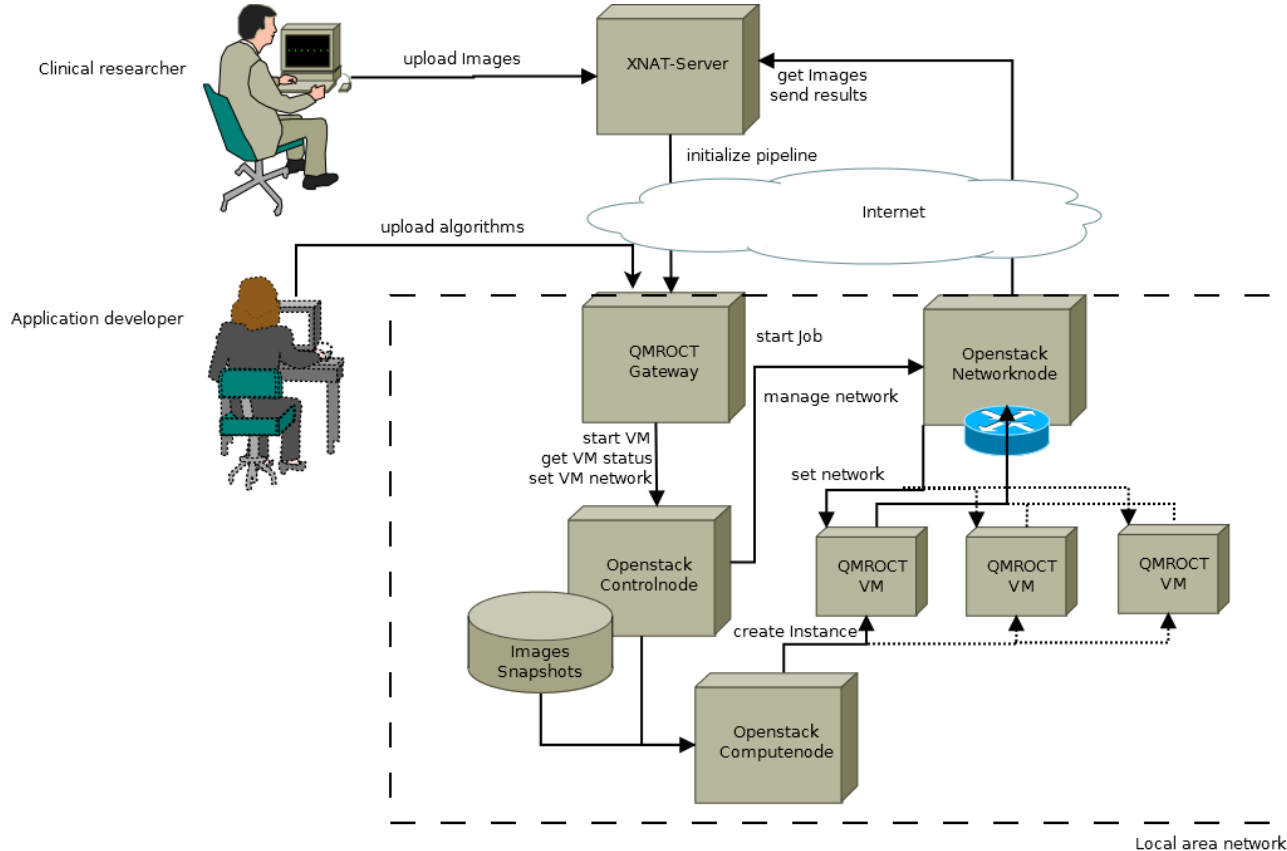

HTW Berlin

- Computer Science department

Tasks

- Developing a server infrastructure
(archive data and run algorithms)
- Web interface for medical research (XNAT)
- Web interface for algorithm developers (Custom)

Server Infrastructure

XNAT

- Start Pipeline

Gateway

- Receive job
- Forward to

OpenStack

- VMs
- Send result

Communication

- REST APIs

XNAT

Filesystem

- Stores DICOM files
- Any other file

Database

- Stores metadata
- Extendable data types
- Stores results - e.g. Key Quality Indicators (KQI)

XNAT - Pipelines

Context of scan files

- XNAT → Projects → Subjects → Sessions → Scans

Parameters are parsed to remote application

- Project, Subject, Session
- Hostname, User (Token), Password (Token)

Application (e.g. shell script)

- Access REST API via CURL using parameters

XNAT - Researcher Interface

Scans

Scan	Type	Series Desc	Usability	Files	Note
302000	Volume IR	Volume IR	usable	Show Counts	
302001	Volume IR	Volume IR	usable	Show Counts	
Total Counts					

Scan Files

- Thumbnails

History

Action	Launch Time	Status	Note

Assessments

Experiment	ID	Project	Date
KQIF	qmroctxnat_E00015 Test		

Results

- KQI

Gateway - Developer Interface

The screenshot shows a web browser window titled "Matlab Script Uploader". The interface includes a "DROP HERE" area with a "+ Browse" button. Below this is a table of uploaded Matlab files. To the left of the table are sections for "DICOMs" and "Executables". At the bottom, there is a text input field with the command `../dicom-dict-OCT.txt "5"` and an "Execute Script" button.

Matlab Script Uploader

DROP HERE

+ Browse

Matlab files			
Name	Date	Size	
loadDicomOCTAndSLO.m	17.01.14 12:26:39	4.92 KB	Compile
qmroct_octread.m	18.12.13 17:09:50	0.08 KB	Compile
qmroct_octread_varargin.m	06.01.14 20:38:34	2.06 KB	Compile
qualIntensity.m	17.01.14 12:26:38	0.17 KB	Compile

DICOMs

- ncrc_S01285 (IM-0001-0001.dcm IM-0002-0060.dcm)
- ncrc_S01322 (00130001 00140060)**
- ncrc_S01333 (00110001 00120144)

Executables

- run_loadDicomOCTAndSLO.sh (17.01.14 12:29:22)
- run_qmroct_octread_varargin.sh (06.01.14 20:41:11)

../dicom-dict-OCT.txt "5" [Execute Script](#)

Upload Matlab Files
Compile

Define CLI params
Run with test data

Deploy (Update VM)
Git - Version Control

OpenStack

Can start and stop VMs

VMs are based on snapshot which contains

- matlab algorithms + runtime environment
- test data
- execution scripts

Update Snapshot

- when new algorithm is deployed

OpenStack - Problems

Start a new VM for every job

- Resources are allocated dynamically
- Security: VM with scans deleted after use

Problems (low hardware resources)

- Starting and stopping VM takes 4 minutes each
(Processing data only takes 30 seconds)
→ Need to re-use VMs
- No error handling yet

Current Use Case

When a new scan session is uploaded

- start pipeline manually (could be automated with XNAT)
- VM processes all available algorithms for these scans
(using a shell script)
- VM sends results for every algorithm to XNAT

Todo at AMC

Enabling new use cases with **workflow management**

- execute one algorithm per scan session as one job
- execute new algorithm with all available sessions

Tools

- **WS-PGRADE** with **gUSE**

Hopefully better control of OpenStack resources
